

Anas Bilal AlSamneh

Amman, Jordan | 0798512411 | anasalsamneh@gmail.com | github.com/Anas-sam

PROFESSIONAL SUMMARY

Dedicated SOC Analyst and Cybersecurity graduate specializing in continuous security monitoring, SIEM log correlation, and proactive threat hunting. Uniquely leverages a robust background in full-stack web development and backend architecture to reverse-engineer attack vectors and anticipate adversary behavior at the application layer. Adept at transforming raw network telemetry into actionable threat intelligence, mapping advanced persistent threats (APTs) to the MITRE ATT&CK framework, and executing rapid threat containment. Focused on reducing mean time to detect (MTTD) and mean time to respond (MTTR) through deep-dive packet analysis and resilient infrastructure defense.

CORE TECHNICAL PROFICIENCIES

Security Operations & IR: Threat Hunting | Alert Triage | Digital Forensics and Incident Response (DFIR) | Cyber Kill Chain | Vulnerability Management | Phishing Analysis | EDR Solutions

SIEM & Telemetry: Splunk Enterprise (Advanced SPL) | Elastic Stack (ELK) | SOAR Concepts | Wireshark (PCAP Analysis) | Network Traffic Analysis (NTA) | Zeek/Suricata

Digital Forensics: Volatility 3 | Autopsy | Evidence Preservation | File Carving | Registry Hive Analysis | Memory Forensics | YARA Rule Creation | Malware Reverse Engineering

Systems & Defense: Linux Server Administration | Windows Server | Python | Rust | PHP | Secure Session Management | IAM | OWASP Top 10 Mitigation

PROFESSIONAL EXPERIENCE & SECURITY OPERATIONS

Enterprise SIEM Threat Hunting & Alert Triage | *Live Incident Simulation*

Operational Scope: Spearheaded comprehensive digital forensic investigations within a centralized Splunk SIEM environment, acting as the primary line of defense against simulated enterprise-grade intrusions.

Telemetry Analysis: Ingested and analyzed over 50+ GB of heterogeneous network telemetry, including Windows Event Logs (Sysmon), FortiGate firewall traffic, and Intrusion Detection System (IDS) alerts, to actively hunt for hidden adversaries.

Strategic Execution: Formulated 30+ highly optimized Advanced SPL queries to filter through over 2.5 million raw events, successfully isolating critical Indicators of Compromise (IOCs) and reducing manual triage time by 45%.

Threat Resolution: Mapped 15 distinct adversarial techniques directly to the MITRE ATT&CK framework, effectively tracking lateral movement and privilege escalation to disrupt the attack chain before data exfiltration.

Live Server Incident Response & Containment | *Rapid Triage Operations*

Incident Context: Directed the immediate digital forensics and incident response (DFIR) protocol during an active, high-severity prompt injection attack on a hosted Linux web server.

Real-Time Triage: Executed live dynamic monitoring of process executions and unauthorized outbound connections to successfully identify the zero-day intrusion vector.

Containment Strategy: Contained the active threat and terminated rogue payload executions within 15 minutes of initial detection, completely preventing root-level privilege escalation.

Recovery & Hardening: Achieved a 100% recovery rate with zero data loss, subsequently deploying hardened bash configurations and IP blacklists to neutralize repeat exploitation attempts.

Full-Stack Web Developer & Infrastructure Defense | *Clever Mind POB* | *July 2025 – July 2026*

Infrastructure Scope: Engineered and secured a robust backend server infrastructure from the ground up, integrating aggressive security controls to protect normalized relational databases handling over 15,000 monthly user requests.

Active Defense: Shifted the development paradigm to a "security-first" model by continuously auditing inbound HTTP requests, analyzing network telemetry, and actively filtering anomalous application-layer traffic.

Threat Mitigation: Maintained 99.9% server uptime and mitigated 100% of detected application-layer injection attempts by enforcing strict parameterization, role-based access controls (RBAC), and secure JWT session handling.

Architectural Impact: Optimized backend database architecture and query logic, achieving a 30% reduction in query latency while simultaneously eliminating critical vulnerabilities and shrinking the overall attack surface.

APPLIED DIGITAL FORENSICS & ADVANCED ANALYSIS

Volatile Memory Forensics Mini-Suite | *Capstone Project* | *October 2025 – May 2026*

Development Scope: Architected, programmed, and deployed a highly specialized Python-based digital forensics toolset engineered to execute deep-dive volatile memory analysis.

Data Integration: Orchestrated complex data integration strategies and rigorous plugin testing phases to parse 4 GB Windows memory dumps, automating the detection of stealthy rootkits and unauthorized persistence mechanisms.

Forensic Automation: Automated the enumeration of over 100 concurrent system processes and mapped live outbound TCP/UDP connections, accelerating the identification of C2 (Command and Control) beaconing.

Threat Intelligence: Correlated extracted memory artifacts against industry threat intelligence feeds, successfully isolating 5 distinct malware signatures and reducing the overall malware analysis lifecycle by 60%.

CERTIFICATIONS & TRAINING

- [Industrial Cyber Security | Cisco](#)
- [Ethical Hacker | Cisco](#)
- [Cyber Threat Management | Cisco](#)
- [AWS Cloud Technical Essentials | Coursera](#)
- [Introduction to Scrum Master Training | Coursera](#)

EDUCATION

Bachelor of Science in Cybersecurity | Jordan University of Science and Technology (JUST)

Graduated: July 2026

Relevant Coursework: Network Security, Incident Response, Digital Forensics, Web Application Security, Malware Analysis, Reverse Engineering
